See current price list for availability of items.
We reserve the right to modify the design and manufacture of the products and materials described in this catalogue.
The pictures of the products are supplied for information only.

The order comprises :
- the contract signed by both parties, or the purchase order and the acknowledgement of receipt,
- eventually, special or specific additional conditions,
- sale general conditions, available upon request are part of the order.

FLEXIBLE COUPLINGS

I - GENERAL

I.1 - FUNCTION OF A FLEXIBLE COUPLING

When transmitting torque from a drive shaft to a driven shaft, flexible couplings :

- absorb and dampen **irregularities** in the **torque**,
- distribute peak loads,
- allow **misalignments and offsets** between the shafts,
- permit some **distortions** in the mounting beds,
- avoid the unwelcome constraints that may occur if a rigid coupling were fitted in the same conditions,
- allow a lighter construction, with **wider tolerances**, and lower cost.

In particular, a flexible coupling is absolutely essential if the machines that are coupled are on **flexible mountings**.

Moreover, there is **no play** in a flexible coupling, and it therefore **runs silently, without friction** and does not need to be greased.

I.2 - SELECTION PARAMETERS

The procedure for selecting a coupling is set out below :

In order to select a flexible coupling, therefore, the following parameters should be known :

- **Nominal torque to be transmitted.**
- **Safety coefficient - Nominal torque of the coupling.**
- **Stiffness - Misalignments - Offset.**
- **Dimensions - Space available.**
- **Operating environment - Temperature - External factors.**

I.2.1 - Nominal torque to be transmitted

The nominal torque is the main factor which determines the dimensions of the coupling between the shafts of the machines that are connected directly to it.

The nominal torque to be transmitted is a function of the nominal power to be transmitted and the rotational speed.

$$T \text{ (N.m)} = \frac{7160 \times P \text{ (bhp)}}{N \text{ (rpm)}}$$

$$T \text{ (N.m)} = \frac{9735 \times P \text{ (Kw)}}{N \text{ (rpm)}}$$

The nominal power to be transmitted is that of the driving machine expressed in kilowatts (Kw) or brake horsepower (bhp). The couplings in PAULSTRA's standard range can transmit power from 1 Kw to more than 2,000 Kw.

The rotational speed expressed in revolutions per minute is that of the driving machine and must be less than the maximum speed of the coupling.

The couplings in PAULSTRA's standard range allow high speeds (up to 10,000 rpm), which is greater than electric motor speeds. The maximum speeds indicated can be achieved only if great care is taken during assembly.

In addition to its elastic properties, the rubber has **viscous damping** characteristics which dampen the oscillations (1) and in particular the oscillations which might become excessive during transient periods of peak load.

The dampening effect is produced by irreversibly absorbing the energy which is thus converted into heat. In order to prevent the rubber being damaged by the resultant increase in temperature, especially if running at high speed, it is important to ensure the best possible alignment.

Once the coupling has been chosen, if difficult **peak load conditions** become evident, it would be advisable to choose a flexible coupling with different characteristics.

I.2.2 - Safety coefficient

The following factors should be taken into consideration when selecting the nominal torque of the coupling :

- irregularities in the torque characteristic of the driving and the driven machines (K_1),
- frequency of start-ups (K_2),
- number of hours in operation per day (K_3).

The product K of these three coefficients K_1 , K_2 , K_3 , is called the safety coefficient or the load factor.

Nominal torque of the coupling = Nominal torque to be transmitted x safety coefficient.
An excessive safety coefficient should be avoided as this tends to lead to the selection of a coupling that is oversize and too stiff.

(1) Braking force proportional to the speed of displacement.

I.2.3 - Stiffness - Misalignments - Offsets

A flexible coupling always allows, to varying degrees depending on type, structure and dimensions, displacements in four ways : axial, radial, conical and torsional. A stiffness defined for each of these cases. The stiffness affects the way in which the coupling reacts when subjected to each of the various possible displacements.

Torsional or polar stiffness	Radial stiffness	Axial stiffness	Conical stiffness
			
$K_{\theta} = \frac{\text{Torque}}{\text{Angular displacement}} = \frac{T_{\theta}}{\theta}$ expressed in m.kN/radian	$K_y = \frac{\text{Radial force}}{\text{Corresponding radial displacement}} = \frac{F_y}{Y}$ expressed in m.kN/radian	$K_x = \frac{\text{Axial force}}{\text{Corresponding axial displacement}} = \frac{F_x}{X}$ expressed in daN/mm	$K_{\alpha} = \frac{\text{Misalignment torque}}{\text{Angular misalignment}} = \frac{T_{\alpha}}{\alpha}$ expressed in m.KN/radian

It can be seen that a coupling can absorb misalignment more easily if it is very flexible (ie it is less stiff). With flexible couplings “alignment” is not an arduous, high precision operation as is the case with rigid couplings.

The forces generated by flexible couplings, which are transmitted to the shafts and supports, are, of course, proportional to the magnitude of the misalignments.

I.2.4 - Dimensions - Space occupied

When choosing the coupling, one should bear in mind :

- the dimensions (diameter and length) of the ends of the shafts to which the flanges of the coupling will be fitted,
- the space (diameter and length) available between the machines for the coupling.

I.2.5 - Operating conditions - Temperature - External factors

The natural rubber which has been selected for most of our standard couplings on the basis of its good dynamic qualities :

- is very good for the operating environment of most machines,
- is not affected by accidental contact with oil or petrol,
- easily withstands temperatures up to 70°C.

A temperature which is permanently higher will lead to progressive deterioration in the properties of the rubber and it would therefore be advisable to consider special compounds. Most PAULSTRA flexible couplings can be made using various types of special compounds that can withstand above average temperatures and remain serviceable in unusual conditions: prolonged contact with hydrocarbons, acids, alkalis or with unusual gases (ozone, chlorine . . .).

If operating conditions are different from those defined for our standard couplings, contact our Technical Department.

II - SELECTING A COUPLING

II.1 - CALCULATING THE NOMINAL TORQUE TO BE TRANSMITTED

Example : To calculate the torque, draw a straight line between the points representing the power to be transmitted and the rotational speed of the machine. The intersection at the central scale indicates the torque value.

Ex. : 25 bhp at 800 rpm → 300 N.m. Draw an horizontal line through this point.

The type of coupling will then be selected, bearing in mind the safety coefficient to be applied and the flexibility required. Refer to the selection chart, page 10.

II.2 - SAFETY COEFFICIENT

II.2.1 - Coefficient K_1 = Driving machine/driven machine

Driving Machine			Driven machine	Examples of driven machines
Electr. motor or turbine	Piston Engine			
	4 to 6 cylin.	1 to 3 cylin.		
1	1.2	1.4	1 Smooth operation - Very low inertia	• Lay shaft • Lighting generator • Series of shafts • Centrifugal pump • Centrifugal fan...
1.2	1.4	1.7	2 Irregular operation - Low inertia	• Fluid agitator • Conveyor belt • Lift • Rotating machine tools for wood and metal • Light textile machines • Folding machines • Geared pumps • Paddle pumps • Fans...
1.4	1.7	2	3 Irregular operation - Average inertia	• Agitator for heavy liquid • Rotary compressor • Roller conveyor • Shredders • Rotary ovens • Wood machinery (planing machine, band-saw . . .) • Printing machines • Mixers • Hoists • Punch • Centrifugal pump for loaded liquid...
1.7	2	2.4	4 Irregular operation - Average inertia - Average shocks	• Concrete mixer • Bar shredder • Shot blaster • Piston compressor with fly wheel • Chain conveyor • Crane • Light rolling mill • Flour mills • Power hammer • Loom • Piston pump with fly wheel • Horizontal mills • Winches • Mine fans...
2	2.4	2.8	5 Irregular operation - High inertia - Hard shocks	• Hammer crushers • Calender (rubber, textiles...) • Piston compressor with low inertia fly wheel • Wood shredder • Excavator • Rolling mill • Piston pump with low inertia fly wheel • Forging press • Paper press • Vibrating sieve...
2.4	2.8	3.3	6 Irregular operation - Very high inertia - Very hard shocks	• Piston compressor without fly wheel • Crusher • Welding generator • Heavy rolling mill • Brick press • Piston pump without fly-wheel...

II.2.2 - Coefficient K_2 = Number of start-ups

Depending on driving machine - driven machine See table K_1	NUMBER OF START-UPS PER HOUR				
	1	10	30	60	120
1	1	1.2	1.3	1.5	1.6
2 3	1	1.1	1.2	1.3	1.4
4 5 6	1	1.05	1.1	1.2	1.2

II.2.3 - Coefficient K_3 = Number of operating hours per day

Number of operating hours per day	0 - 2	2 - 8	8 - 16	16 - 24
Coefficient K_3	0.9	1	1.1	1.2

II.2.4 - Nominal torque of the coupling

Nominal torque of the coupling = Nominal torque to be transmitted x safety coefficient.
The safety coefficient, K, is the product of the three coefficients K_1 , K_2 and K_3 .

The above parameters should enable one or two types of coupling to be selected which are suitable for the application required.

The final choice will be made on the basis of the Data Sheets for the coupling selected, checking :

- The dimensions allowed for the shaft ends.
- The space available.
- The exact values of the misalignments, offset, stiffness.
- And any other parameter (eg : installation).

II.3 - EXAMPLES

II.3.1 - Electric motor - Pump

Driving machine Standard electric motor 160 M Power : 15 Kw Speed : 3000 rpm End of shaft Ø : 42 mm - length : 110 mm	Driven machine : Standard C2 water pump End of shaft Ø : 32 mm - length : 80 mm 30 start-ups/hour 8 hours operation per day
---	---

Nominal torque to be transmitted : chart indicates 5 N.m.

Safety coefficient : $K_1=1$ $K_2=1.3$ $K_3=1$ hence $K=K_1 \times K_2 \times K_3 = 1.3$.

Nominal torque of coupling : $NT = 50 \text{ N.m} \times 1.3 = 65 \text{ N.m}$.

For machines which have a regular cyclic operation with correct alignment, it is not essential to have a highly flexible coupling and so the following couplings would be pre-selected :

CARDAFLEX	80 N.m
PAULSTRA MPP	80 N.m
STRAFLEX	100 N.m

All these couplings can be used at a speed of 3,000 rpm.

In this case, the PAULSTRA MPP 80 N.m coupling would be chosen as it is the only one which will fit the diameter (42 mm) of the end of the motor shaft.

II.3.2 - Electric motor - Compressor

Driving machine : Standard 200 L electric motor Power : 30 kW Speed : 1,500 rpm End of shaft Ø : 55 mm - length : 110 mm	Driven machine : 2 cylinder compressor with fly wheel End of shaft Ø : 60 mm - length : 110 mm Less than one start-up/hour 8 hours operation per day
--	--

Nominal torque to be transmitted : chart indicates 190 N.m.

Safety coefficient : $K_1=1.7$ $K_2=1$ $K_3=1$ hence $K=1.7$.

Nominal torque of coupling : $NT = 190 \times 1.7 = 320 \text{ N.m}$.

The characteristics of the driven machine mean that high torsional flexibility is essential to absorb the cyclic irregularities.

The JUBOFLEX 350 N.m will therefore be selected, having checked that it can accommodate the shaft ends of the machines.

These examples are simple cases. In many instances, this method is adequate for selecting couplings.

In more complex cases (cyclic vibrations, for example), it is advisable to consult our Technical Department.

COUPLING SELECTION CHART

In order to make it easier to select the coupling required, this SELECTION CHART indicates the behaviour of PAULSTRA couplings when under stress.

This rating takes account of the possibilities of misalignments, offset and the resultant forces on the shafts and supports. Each condition is shown :

Braking force proportional to the speed of displacement.

III - EXAMPLES OF INSTALLATION

III.1 Flanged shaft mounting

The most common mounting

III.2 Flywheel mounting

Mounted directly on flywheel.

Ex. : AXOFLEX

Spacer
Mounting with spacer.
Ex. : JUBOFLEX

III.3 Mounting on transmission shaft

Assembly with centred transmission shaft. Ex. : JUBOFLEX

III.4 Mounting in series

Increases the flexibility while keeping the torque constant.
Ex. : AXOFLEX coupling with two sets of studs linked by an "anti-centrifuge" disk.

III.5 Drum brake and disk brake mounting

Disk brake mounting

Drum brake mounting for our couplings with rings : AXOFLEX, RTP

MINIFLEX

Torsional flexibility

Radial flexibility

Axial flexibility

Conical flexibility

DESCRIPTION

- Flexible element :
 - ① Natural rubber block bonded to.
 - ② V-shaped metal armatures.
- Flange : aluminium or cast-iron :
 - ③ Drive segment.

OPERATION

The MINIFLEX coupling is designed with the following features :

- Push fit assembly.
- Compact, smooth cylindrical shape without protrusions.
- The flexible element is precompressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

Advantages :

- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Exceptionally long-life ensured by precompressing the flexible element.
- Tolerance to large misalignment : avoids the need for precise alignment of the machines to be coupled.

Recommendation :

- It is recommended that the coupling should not be subjected to axial tension which might cause the flexible element to slip from the drive segment on the flange.

DIMENSIONS

Flange supplied unbored

1 Nm $\neq$ 0.1 mkg

ASSEMBLY

The coupling is assembled and disassembled axially which entails moving one of the machines. This procedure is not difficult and can be done quickly, as at least one of the machines being coupled is not heavy.

Method :

- Fit an opposing pair of armatures of the flexible element half-way onto the drive segments of one flange.
- Position the second flange.
- Push the two flanges together to engage the armatures of the flexible element.
- Release.

Example : electric motor/pump coupling mounted on fly wheel and grooved shaft.

MPP

* * Torsional flexibility	* Radial flexibility	Push fit Axial flexibility	* Conical flexibility
--------------------------------------	---------------------------------	---------------------------------------	----------------------------------

DESCRIPTION

- Flexible element ① : polyurethane in the form of a Maltese cross.
- Flange ② : cast iron with drive segments ③ supplied unbored (except 633054 and 633055).

Variations : For assemblies with a ring or spacer, consult our technical manuals.

OPERATION

The MPP coupling is designed with the following features :

- Push fit assembly,
- Smooth, compact cylindrical shape, without protrusions,
- The flexible element operates under compression,
- Safe in use,
- Temperature range - 30°C to + 70°C in continuous operation.

Advantages :

- Reduced size,
- Easy to use.

Recommendation :

- It is recommended that the coupling should not be subjected to axial tension which might cause the flexible element to slip off the drive segments on the flanges.

For assemblies with flange or spacer : ask our technical notes.

JUBOFLEX

Torsional flexibility

Radial flexibility

Axial flexibility

Conical flexibility

DESCRIPTION

- Flexible element :
 - ① Precompressed natural rubber,
 - ② Bonded metal spacers,
 - ③ Precompression band (to be removed after installation).
- Flange :
 - ④ Die-cast steel (except 632320 which is cast-iron).

OPERATION

The JUBOFLEX coupling is designed with the following features :

- Radial disassembly without moving the machines that are coupled.
- The flexible element is precompressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

Advantages :

- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Very safe in use and the precompression ensures very high resistance to oscillation
- Tolerance to large misalignment: avoids the need for precise alignment of the machines to be coupled.

Recommendation :

- In use, precompression is achieved by the fixing bolts, and the JUBOFLEX coupling operates without the precompression band round the flexible element.

DIMENSIONS

JUBOFLEX Steel flanges except 632320 **JUBOFLEX Cast-iron flanges : ref. 632320**

JUBOFLEX WITH SEPARATE HUB

Torsional flexibility

Radial flexibility

Axial flexibility

Conical flexibility

DESCRIPTION

- Flexible element :
 - ① Precompressed natural rubber.
 - ② Bonded metal spacers.
 - ③ Precompression band (to be removed after installation).
- Flange :
 - ④ Die-cast steel specially bored to fit the separate hub.
 - ⑤ Universal separate hub (not supplied by PAULSTRA).

OPERATION

In addition to the characteristics described above, the separate hub used in conjunction with the JUBOFLEX coupling provides the advantage :

Ready to assemble without machining the flanges.

Advantages :

- Reduced size.
- Simplified axial positioning.
- Easy to assemble and disassemble.
- Reduction of costs by simplifying the machining required for the shafts and flanges.

Recommendation :

- In use, precompression is achieved by the fixing bolts and the JUBOFLEX coupling operates without the precompression band round the flexible element.

DIMENSIONS

1200	600	6.30	15	60	10.6	1.14

1 Nm $\neq$ 0.1 mkg

ASSEMBLY

- Precompression for the initial installation is achieved by a band ③ placed round the outside (our flexible elements are delivered with this band).
- Position the flexible element with its band to attach three non-adjacent holes to the three arms of one flange, and then the three other holes to the other flange.
- Tighten the bolts to the following torques :

Nominal torque N.m	Reference	Torque value N.m
40	632027/632205	21
90	632023/632210	41
160	632017/632217	72
250	632029/632226	113
350	632031/632502	240
500	632043/632503	350
700	632025/632505	350
1200	632320/632507	350

- Cut the original band or remove the disassembly band.

Example : internal combustion engine/generator coupling mounted on a ring attached to the fly wheel.

JUBOFLEX "S"

Torsional flexibility

Radial flexibility

Axial flexibility

Conical flexibility

DESCRIPTION

- Flexible element :
 - ① Precompressed natural rubber.
 - ② Bonded metal reinforcing mountings.
 - ③ Precompression band (to be removed after installation).
- Flange :
 - ④ Die-cast steel (except 632267 which is cast-iron).

OPERATION

The JUBOFLEX "S" coupling is designed with the following features :

- Radial disassembly without moving the machines that are coupled.
- The flexible element is compressed during assembly, which extends the range of operating conditions where the rubber is not subject to tension.

Advantages :

- JUBOFLEX "S" has a greater load capacity than the standard JUBOFLEX.
- Highly effective attenuation of cyclic irregularities and peaks in the torque.
- Due to the precompression, the JUBOFLEX "S" has very good resistance to torsional peaks.
- Tolerance to large misalignment : avoids the need for precise alignment of the machines to be coupled.

Recommendation :

- In use, precompression is achieved by the fixing bolts, and the JUBOFLEX "S" coupling operates without the precompression band round the flexible element.

DIMENSIONS

* This element has 8 mounting holes.

STRAFLEX

* Torsional flexibility	* Radial flexibility	* * Axial flexibility	* * Conical flexibility
--	---	--	--

DESCRIPTION

- Flexible element :
 - ① Metallic bobbins linked together by rayon fibres.
 - ② The whole unit ① is potted in natural rubber and is hexagonal.
- Flange ③ : forged steel.

OPERATION

The STRAFLEX coupling is designed with the following features :

- Radial disassembly without moving the machines that are coupled.
- Reduced size.
- Used at relatively high rotational speeds.

Recommendation :

- The reinforced textile structure means that it has a low tolerance to irregularities in the torque.

DIMENSIONS

Assembly of models ref. 635301, 635302, 635303, 635304

Assembly of models ref. 635105, 635106, 635107 : screws with countersunk heads

Warning: The coupling ref. 635100 is equipped with welded studs instead of the standard bolts. It's assembly is done simply by pushing the elements on the flanges.

STRAFLEX WITH SEPARATE HUB

* Torsional flexibility	* Radial flexibility	* * Axial flexibility	* * Conical flexibility
--	---	--	--

DESCRIPTION

- Flexible element :
 - ① Metallic bobbins linked together by rayon fibres.
 - ② The whole unit ① is potted in natural rubber and is hexagonal.
- Flange :
 - ③ Forged steel specially bored to accommodate the separate hub.
 - ④ Universal separate hub (not supplied by PAULSTRA).

OPERATION

In addition to the characteristics described above, the separate hub used in conjunction with the STRAFLEX coupling provides the advantage : ready to assemble without machining.

Advantages :

- Reduced size.
- Simplified axial positionning.
- Easy to assemble and disassemble.
- Reduction of costs by simplifying the machining required for the shafts and flanges.

Recommendation :

- The reinforced textile structure means that it has a low tolerance to irregularities in the torque.

6000	3000	2	75	200	172	3.44

1 Nm $\neq$ 0.1 mkg

ASSEMBLY

Method :

- Mount the flanges on the shafts of the machines to be coupled.
- Position the flexible element to attach three non-adjacent bobbins to one flange with bolts, then attach the three other bobbins to the second flange.

NOTE : For the 635100 coupling, the bolts are replaced by welded studs and so this must be assembled by pushing the flanges together.

**Example : electric motor/volumetric pump coupling :
mounted on channelled shaft and flywheel.**

---	--	---	---

DESCRIPTION

- Flexible element ① composed of :
 - ② Natural rubber ring.
 - ③ Internal armature bonded to the rubber.
 - ④ External collar force fitted to the rubber.
- Flanges ⑤ : die-cast steel fixed onto the internal armature ③ and collar ④.

OPERATION

The TORSOFLEX coupling is designed with the following features :

- The rubber ring is precompressed to provide high torsional flexibility.
- Smooth, compact, cylindrical shape without protrusion.
- Radial disassembly without moving the coupled machines (the flexible element should be compressed axially using clamps).

Advantages :

- Very high resistance to oscillation.
- High rotational speed.

Recommendation :

- As the TORSOFLEX coupling is usually used at high speed, the assembly must be well aligned.

ASSEMBLY

Method :

- Mount the flanges ⑤ on the ends of the shafts of the machines.
- Fix the flanges to the internal armature ③ and to the external collar ④.

CARDAFLEX

* * Torsional flexibility	* Radial flexibility	* * Axial flexibility	* * Conical flexibility
--	---	--	--

DESCRIPTION

There are two variations of the CARDAFLEX coupling :
hollow hub and solid hub :

- Flexible element :
 - ① Formed of solid natural rubber.
 - ② External steel surround, bonded to the rubber.
 - ③ Triangular hub : a hollow hub bonded to the rubber and attached to the flange ⑤, or a solid hub which accommodates a grooved or keyed shaft.
- Steel flanges :
 - ④ round.
 - ⑤ triangular.

OPERATION

The CARDAFLEX coupling is designed with the following features :

- Safe in use.
- Fairly low conical stiffness.
- Compact shape
- Good performance at high speeds.

Advantages :

- Especially in the case of the CARDAFLEX solid hub coupling, the space occupied by the unit is much reduced.
- The outer surround of the flexible element can be centred directly on-to the flywheel of one of the machines to be coupled.

DIMENSIONS

Hollow hub coupling

Solid hub coupling

ASSEMBLY

Method :

- Mount the round flange onto the shaft of one machine.
- Mount :
 - The triangular flange onto the other shaft (hollow hub coupling).
 - The flexible element onto the other shaft (solid hub coupling).
- Attach the flexible element to the round flange.

**Example : internal combustion engine/hydraulic pump coupling :
mounted on keyed shaft and on pulley.**

RADIAFLEX RTP

 Torsional flexibility	 Radial flexibility	 Axial flexibility	 Conical flexibility
---	--	---	---

DESCRIPTION

- Flexible element made up of a variable number of FLEXIBLE STUDS ① depending on the torque to be transmitted :
 - ② Solid natural rubber blocks in the form of a truncated cone.
 - ③ Internal armature bonded to the rubber.
 - ④ Threaded stud.
 - ⑤ External armature bonded to the rubber.
 - ⑥ Studding welded to armature.
 - ⑦ Cylindrical metal cover.
- Steel disks :
 - ⑧ Two identical disks, bolted to the flanges ⑩ and with slits ⑨ to house the studs ①.
- Flanges : ⑩ die-cast steel.

OPERATION

The RADIAFLEX RTP coupling is designed with the following features :

- The studs can be removed radially without moving the coupled machines.
- At low and average torque: the rubber operates under compression.
- At high torque: there is progressive thrust of the rubber against the metal cover ③.
- Safe in use.
- It can absorb the effects of tension or compression axially (for example: push and pull of a helical screw).

DIMENSIONS

XX' Section

Alternative mount:

Ref. 526401Δ60

The alternative mount 526401Δ60 is softened. Its radial stiffness is equal to $\frac{2}{3}$ of the standard mounting ref. 522131Δ60.

Warning: A coupling equipped with the alternative mounts 526401 can only transmit 80% of the torque of the standard version.

ASSEMBLY

Method :

- Mount each of the flanges onto the ends of the corresponding shafts.
- Use the specially machined recess to centre the disks onto the flanges and screw together.
- Attach the external armature of the studs to the appropriate disk.
- Attach the internal armature of the studs to the other disk.

Note :

The slits ⑨ are designed to take the loose locating sleeves ⑪ to enable the individual flexible studs ① to be mounted and removed radially.

Torque to be applied to the stud fixing bolts :

- Stud RTP2 : 522090 Ø 12 → 7.5 N.m.
- Stud RTP4 : 522131 Ø 16 → 18.5 N.m.
- Stud RTP6 : 522240 Ø 24 → 64.0 N.m.

CORDIFLEX

* * *	Torsional flexibility	* *	Radial flexibility	Push fit	Axial flexibility	* *	Conical flexibility
-------	-----------------------	-----	--------------------	----------	-------------------	-----	---------------------

DESCRIPTION

- Flexible element :
① 6 fairly hard natural rubber shaped support blocks, on the inside edge of the outer ring of the coupling.
 - Flange :
② inside flange has 6 arms which fit axially between the blocks by "blind axial" assembly.
 - Outer ring :
③ Ring with teeth that hold the blocks.
- Standard SAE fixing and centring.

OPERATION

The CORDIFLEX coupling is designed to have the following features :

- Simplicity of design and assembly of the flexible elements making it easy to vary the torsional stiffness simply by replacing the blocks.

Advantages :

- SAE centring.
- The coupling is very slim.

DIMENSIONS

TETRAFLEX

Torque from 160 to 250 N.m.

Torsional flexibility

Radial flexibility

Axial flexibility

Conical flexibility

DESCRIPTION

- Flexible element comprising :
 - ① Natural rubber in the form of a cross.
 - ② A floating aluminium star, whose arms are bonded to the rubber.
 - Mountings :
 - ③ 2 aluminium bosses, bonded to the rubber, which will be attached to one of the machines.
 - ④ 2 aluminium bosses, bonded to the rubber, which will be attached to the other machine.
 - ⑤ Band for precompressing the rubber before assembly.
- 2 retaining bars are supplied although not shown in the photo.

OPERATION

The TETRAFLEX coupling is designed with the following features :

- Binary symmetry which allows considerable conical misalignment to the order of 8°.
- Precompression of the rubber when assembled which limits operation under tension.

Advantages :

The floating star allows :

- Increased torque capacity without reducing the axial flexibility, hence reduced size for a given torque.
- Rotation at higher speeds as the star ensures that the arms are anchored centrifugally.
- The possibility of using a floating shaft (at moderate speed) as the increased radial rigidity provides self-centering for the coupling.

DIMENSIONS

Nominal torque N.m	Max torque N.m	Max speed rpm	A mm	B mm	Reference	G mm	J mm	F mm
160	400	6000 (1)	110	70	630400	77	16	59
250	600	6000 (1)	110	90	630408	77	16	79

(1) for supported driving and driven shafts (1500 rpm with floating shaft).

The maximum torque is considered to be an infrequent start-up torque and is not periodic.

OPERATING CHARACTERISTICS

Nominal torque N.m	Vibrat. coupling N.m	Torsion under NT degrees	STIFFNESS			
			AXIAL daN/mm	RADIAL daN/mm	TORSIONAL m.KN/rad.	CONICAL m.KN/rad.
160	80	8	10	40	1.14	0.143
250	125	8	20	80	1.72	0.344

ASSEMBLY

Method :

- Attach the coupling to the flanges (not supplied), eg using bolts.
- Install the centrifugal retaining bars supplied with the coupling.
- Cut the band.

Compression is ensured by the mountings.

- Replace the band before disassembling.
- Mounting on floating shaft : the maximum conical misalignment allowed at 1500 rpm is :
10° for ref. 630400,
6° for ref. 630408.

TETRAFLEX

Torque from 1 000 to 8 000 N.m.

Torsional flexibility

Radial flexibility

Axial flexibility

Conical flexibility

DESCRIPTION

- Flexible element comprising :
 - ① Natural rubber in the form of a cross.
 - ② A floating aluminium or steel star, whose arms are bonded to the rubber.
- Mountings :
 - 2 aluminium bosses, bonded to the rubber which will be attached to one of the machines.
 - 2 bosses bonded to the rubber which will be attached to the other machine.

OPERATION

The TETRAFLEX coupling is designed with the following features :

- Binary symmetry which allows considerable conical misalignment.
- The rubber is precompressed from manufacture which limits operation under tension.

Advantages :

The floating star allows :

- Increased torque capacity without reducing the axial flexibility, hence reduced size for a given torque.
- Rotation at higher speeds as the star ensures that the arms are anchored centrifugally.
- A good torque/speed ratio.

DIMENSIONS

Nominal torque N.m	Max Torque N.m	Max speed rpm	A mm	B mm	Reference	G mm	J mm	F mm	W mm	X mm
2000	3000	3500	350	90	630802	253	14.2	90	58	-
2500	3700	3000	400	85	630419	352	16	62	55	190
4000	6000	3000	408	108	630470	358	17	86	48	170
6000	9000	3000	420	130	630420	350	18	88	50	185

1 Nm $\approx$ 0.1 mkg.

The maximum torque is considered to be a dynamic infrequent torque and of short duration.

OPERATING CHARACTERISTICS

Nominal torque N.m	Vibatory coupling N.m	Torsion under NT degrees	STIFFNESS		
			AXIAL daN/mm	RADIAL daN/mm	TORSIONAL m.KN/rad.
2000	1000	7	10	44	17
2500	1250	8	13	40	18
4000	2000	8	21	72	29
6000	3000	9	26	86	38

1 Nm $\approx$ 0.1 mkg

ASSEMBLY

Can be mounted on units that are badly misaligned.
These couplings must not be mounted on floating shafts.

AXOFLEX

* Torsional flexibility	* Radial flexibility	* * Axial flexibility	* Conical flexibility
--	---	--	--

DESCRIPTION

- **Flexible element** comprising a variable number of flexible bushes, depending on the torque to be transmitted.
 - ① Inner with tapped or smooth holes (normal mounting or on flywheel).
 - ② Precompressed natural rubber bonded to inner 1 and to outer the half-cylinders ③.
 - ③ Half-cylinders bonded to the rubber.
 - ④ Outer housing ensuring precompression of rubber by exerting pressure on the half-cylinders ③.
- **Steel disks :**
 - ⑤ Flange to which the inner studs are attached (normal mounting).
 - ⑥ Disk to which the studs are attached (flywheel mounting).
- **Die cast steel hubs :**
 - ⑦ The two hubs are identical. They may be bolted to disks ⑤ or ⑥ depending on the mounting used.

OPERATION

The AXOFLEX coupling is designed with the following features :

- Radial disassembly without moving the machines that are coupled (usually very large machines).
- Precompression of the rubber which limits operation under tension.

Advantages :

- Good axial flexibility which allows great axial displacement, for example in the case of conical rotor machines.

915494	525403	14	324601	1	351674	1

ASSEMBLY

Method : (normal)

- Attach each of the flanges to the ends of the appropriate shafts.
- Use the specially machined recess to centre the disks onto the flanges and screw together.
- Attach the external armature of the studs to the appropriate disk.
- Attach the internal armature of the studs to the other disk.

Torque for the bolts attaching the studs.

Ø 12 → 75 N.m

Ø 14 → 122 N.m

Ø 12 → 185 N.m

Method : (flywheel)

- Mount the flange onto the shaft end.
- Bolt the disk onto the flange.
- Attach the external armature of the studs to the disk.
- Attach the internal armature of the studs to the flywheel of the second machine.

SAE FLANGES

MOUNTING ON SAE FLANGES

For couplings used with internal combustion engines (generating sets, motorised pumps) attachment flanges can be used to connect directly to the engines' flywheels. On request we can suggest couplings with flanges that conform to the SAE standard :

SAE	Ø A 17	Ø G	n x J
6½	215.90	200.00	6 x 8,5
7½	241.30	222.30	8 x 8,5
8	263.52	244.50	6 x 10,5
10	314.40	295.30	8 x 10,5
11½	352.40	333.40	8 x 10,5
14	466.70	438.15	8 x 13
16	517.52	489.00	8 x 13
